Grading Rubric (30 Points Total)

You must provide 5 responses that identify a problem and provide a recommendation for improvement. Each response is worth 6 points, broken down as follows:

Evaluation Criteria	**Full Credit (3 Points)**	**Partial Credit (1.5 Points)**	**No Credit (0 Points)**
Problem Identification	Accurately and clearly identifies a specific poor dietary habit from the case study that conflicts with the *Dietary Guidelines for Americans*.	Identifies a poor dietary habit, but the description is vague, inaccurate, or only loosely connected to the *Dietary Guidelines for Americans*.	Fails to identify a relevant dietary problem from the case study, or the identified issue is incorrect.
Proposed Recommendation	Provides a practical, specific, and healthier alternative that addresses the identified problem and aligns with the *Dietary Guidelines for Americans*.	Suggests an alternative, but it lacks specificity, is not a realistic swap, or only partially aligns with the *Dietary Guidelines for Americans*.	Fails to provide a recommendation, or the suggested alternative is nutritionally poor and does not align with the *Dietary Guidelines for Americans*.

Example of a response that would receive Full Credit (6/6) points:

- **Problem Identified:** Person A's diet is heavily reliant on refined carbohydrates, specifically the white pasta at lunch and the white bread at dinner. These refined grains lack dietary fiber. *(3/3 Points)*
- **Recommendation:** Person A should switch to whole grains to increase their fiber intake and support gut health. Healthy alternatives include choosing a whole wheat pasta at lunch and whole wheat bread at dinner. *(3/3 Points)*
